DETAILED ACTION

Allowable Subject Matter

1. Claims 1-36 are allowed.

The prior art fails to teach nor fairly suggests an imaging device, a **digital memory buffer**, first routines for conveying the initially stored raw image data away from the digital memory buffer to a second memory to provide space for storing additional, subsequently captured images, wherein the raw image data is stored in uncompressed form in the second memory **and wherein the second memory has the capacity to store complete raw image data for multiple raw images**, second routines for conveying the raw image data from the second memory to a processor for processing the raw image data and for storing the processed image data, and a central processing unit coupled to the imaging device and to the digital memory buffer, for executing according to a predetermined set of priorities the first and second routines, wherein the first routines are assigned priority over the second routines to thereby facilitate the rapid conveyance of raw image data away from the digital memory buffer, as claimed in Claim 16.

The prior art neither teaches nor fairly suggests an imaging device, a **digital memory buffer**, and a central processing unit coupled to the imaging device and the digital memory buffer, **for transferring the raw image data to a second memory that is external to any processing chip**, transferring the raw image data and storing the processed image data according

Art Unit: 2612

to a predetermined set of priorities wherein **transferring the raw image data to the second memory has a higher priority than transferring the raw image data to a processor**, as claimed in Claim 19.

The prior art neither teaches nor fairly suggests a first spooler routine which moves raw image data out of a **digital frame buffer and into a second memory that is external to any processor**, the first spooler routine having a highest priority, a processing/compression routine which compresses raw image data from the second memory, the processing/compression routine having a middle priority, a second spooler routine which moves compressed image data into flash memory, the second spooler routine having a lowest priority, **and a processor for executing the routines according to their priority and according to available processor time**, as claimed in Claim 24.

Claims 27, 35 and 36 are substantially similar to Claims 19, 24, and 27.
